C++面向对象高级编程

GeekBand 极客班 互联网人才+油站！

极客班携手网易云课堂，针对热门IT互联网岗位，联合业内专家大牛，紧贴企业实际需求，量身打造精品实战课程。

专业课程 + **项目碾压**

- 顶尖专家技能私授
- 贴合企业实际需求
- 互动交流直播答疑

- 学员混搭线上组队
- 一线项目实战操练
- 业内大牛辅导点评

C++系统工程师

iOS开发工程师

Android开发工程师

PM产品经理

C++ 面向對象程序設計

(Object Oriented Programming, OOP)

侯捷

你應具備的基礎

- 曾經學過某種 **procedural language (C 語言最佳)**
  - 變量 **(variables)**
  - 類型 **(types) : int, float, char, struct ...**
  - 作用域 **(scope)**
  - 循環 **(loops) : while, for,**
  - 流程控制 **: if-else, switch-case**
- 知道一個程序需要編譯、連結才能被執行
- 知道如何編譯和連結
  (如何建立一個<u>可運行程序</u>）

我們的目標

- 培養正規的、大氣的編程習慣

- 以良好的方式編寫 C++ class
  - class without pointer members
    - Complex
  - class with pointer members
    - String

Object Based
(基於對象)

- 學習 Classes 之間的關係
  - 繼承 (inheritance)
  - 複合 (composition)
  - 委託 (delegation)

Object Oriented
(面向對象)

3

complex.h
complex-test.cpp

string.h
string-test.cpp

C++ 的歷史

- **B 語言 (1969)**
- **C 語言 (1972)**
- **C++ 語言 (1983)**
  (new C ➔ C with Class ➔ C++)

- **Java 語言**
- **C# 語言**

C++ 演化

- **C++ 98 (1.0)**
- **C++ 03 (TR1, Technical Report 1)**
- **C++ 11 (2.0)**
- **C++ 14**

C++

C++ 語言	C++ 標準庫
Bibliography (書目誌)

C vs. C++, 關於數據和函數

C

type
(built-in, struct)

| Data |
| Functions |

create →

variables

…

C++

class, struct

| Data Members |
| Member Functions |

create →

objects

…

C++, 關於數據和函數
complex

實部
虛部

加,減,乘,除,
共軛,正弦,
...
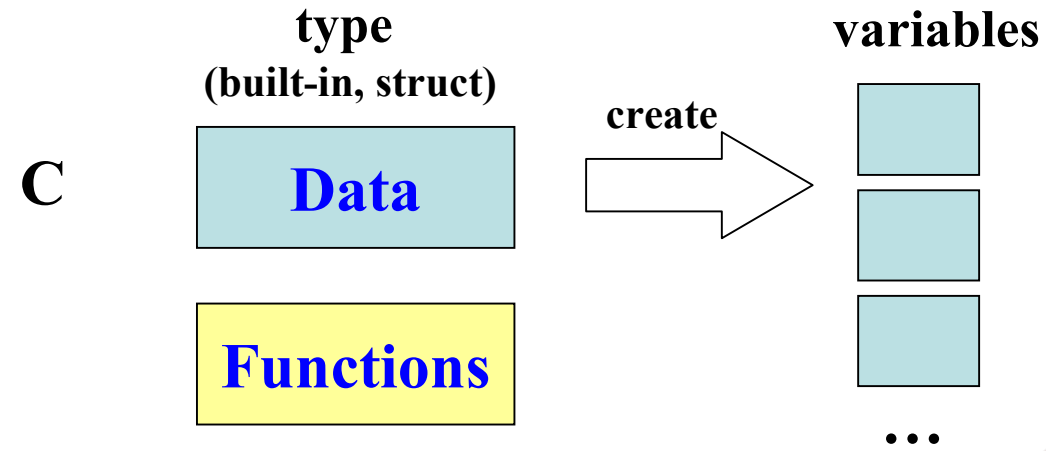

create →

c1

c2

c3

c4

...

```
complex c1(2,1);
complex c2;
complex* pc = new complex(0,1);
```

string

字符 (s)
(其實是個 ptr,
指向一串字符)

拷貝,輸出,
附加,插入,
...
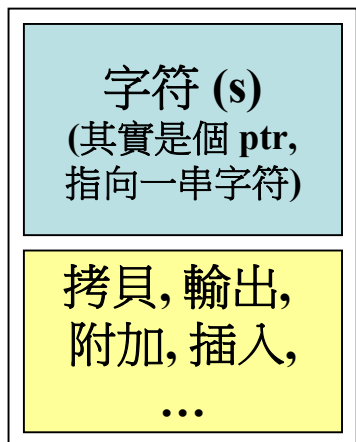

create →
s1

s2

s3

s4

...

```
string s1("Hello ");
string s2("World ");
string* ps = new string;
```

Object Based (基於對象) **vs. Object Oriented** (面向對象)

Object Based : 面對的是單一 **class** 的設計

Object Oriented : 面對的是多重 **classes** 的設計，
　　　　　　　　classes 和 **classes** 之間的關係。

Classes 的兩個經典分類：

- **Class without pointer member(s)**

  complex

- **Class with pointer member(s)**

  string

C++ programs 代碼基本形式

.h (header files)

.cpp

.h (header files)

| Classes
Declaration
(聲明) | **+** | #include <iostream.h>
#include "complex.h"

ex. main() | **+** | 標準庫
Standard
Library |
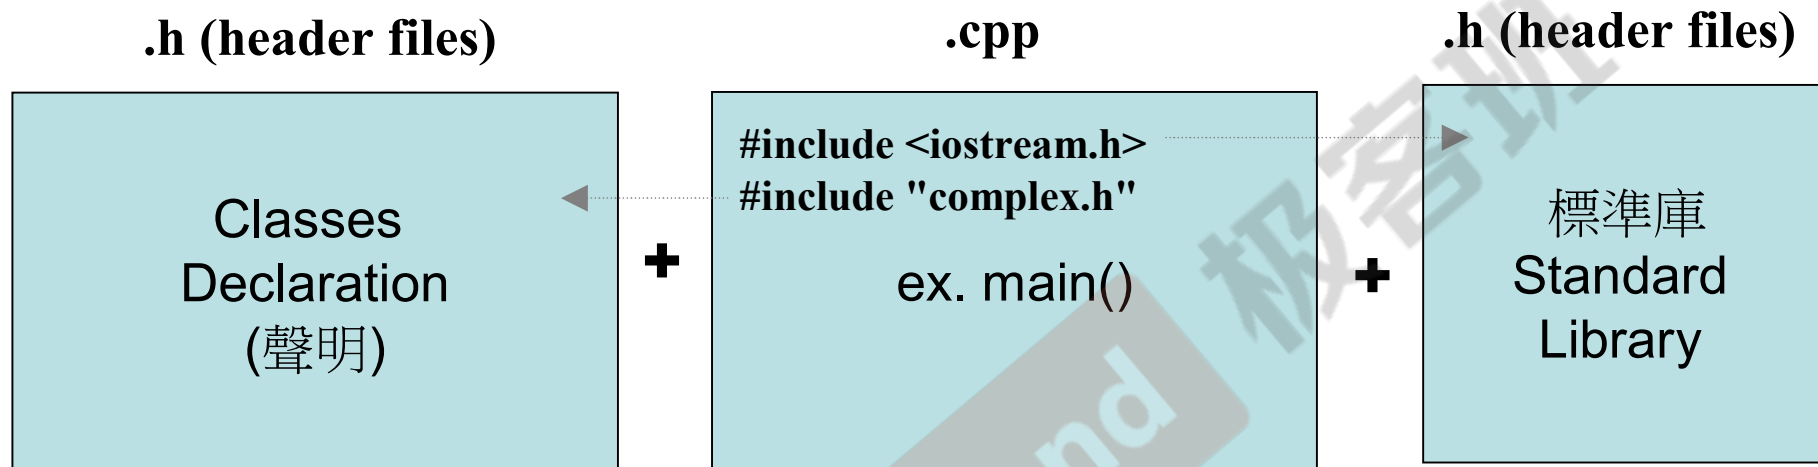

延伸文件名 (extension file name) 不一定是 .h 或 .cpp，
也可能是 .hpp 或其他或甚至無延伸名。

Output, C++ vs. C

C++

```cpp
#include <iostream.h>
using namespace std;

int main()
{
  int i = 7;
  cout << "i=" << i << endl;

  return 0;
}
```

C

```c
#include <stdio.h>

int main()
{
  int i = 7;
  printf("i=%d \n", i);

  return 0;
}
```

Header (頭文件) 中的防衛式聲明

complex.h

```
#ifndef __COMPLEX__
#define __COMPLEX__

...

#endif
```

guard
(防衛式聲明)

```cpp
#include <iostream>
#include "complex.h"
using namespace std;

int main()
{
  complex c1(2,1);
  complex c2;
  cout << c1 << endl;
  cout << c2 << endl;

  c2 = c1 + 5;
  c2 = 7 + c1;
  c2 = c1 + c2;
  c2 += c1;
  c2 += 3;
  c2 = -c1;

  cout << (c1 == c2) << endl;
  cout << (c1 != c2) << endl;
  cout << conj(c1) << endl;
  return 0;
}
```

16

Header (頭文件) 的佈局

```
#ifndef __COMPLEX__
#define __COMPLEX__

#include <cmath>

class ostream;
class complex;

complex&
  __doapl (complex* ths, const complex& r);

class complex
{
...
};

complex::function ...

#endif
```

0 — forward declarations (前置聲明)

1 — class declarations (類 - 聲明)

2 — class definition (類 - 定義)

class 的聲明 (declaration)

class head

class body

```cpp
class complex
{
public:
  complex (double r = 0, double i = 0)
    : re (r), im (i)
  { }
  complex& operator += (const complex&);
  double real () const { return re; }
  double imag () const { return im; }
private:
  double re, im;

  friend complex& __doapl (complex*, const complex&);
};
```

有些函數在此直接定義，
另一些在 body 之外定義

```cpp
{
  complex c1(2,1);
  complex c2;
  ...
}
```

18

class template (模板) 簡介

❶

```cpp
template<typename T>
class complex
{
public:
  complex (T r = 0, T i = 0)
    : re (r), im (i)
  { }
  complex& operator += (const complex&);
  T real () const { return re; }
  T imag () const { return im; }
private:
  T re, im;

  friend complex& __doapl (complex*, const complex&);
};
```

```cpp
{
  complex<double> c1(2.5,1.5);
  complex<int> c2(2,6);
  ...
}
```

19

inline (內聯) 函數

①
```cpp
class complex
{
public:
  complex (double r = 0, double i = 0)
    : re (r), im (i)
  { }
  complex& operator += (const complex&);
  double real () const { return re; }
  double imag () const { return im; }
private:
  double re, im;

  friend complex& __doapl (complex*, const complex&);
};
```

函數若在 **class body** 內定義完成，便自動成為 **inline** 候選人

2-2
```cpp
inline double
imag(const complex& x)
{
  return x.imag ();
}
```

access level (訪問級別)

1

```cpp
class complex
{
public:
  complex (double r = 0, double i = 0)
    : re (r), im (i)
  { }
  complex& operator += (const complex&);
  double real () const { return re; }
  double imag () const { return im; }
private:
  double re, im;

  friend complex& __doapl (complex*, const complex&);
};
```

X

```cpp
{
  complex c1(2,1);
  cout << c1.re;
  cout << c1.im;
}
```

O

```cpp
{
  complex c1(2,1);
  cout << c1.real();
  cout << c1.imag();
}
```

constructor (ctor, 構造函數)

```cpp
complex (double r = 0, double i = 0)
{ re = r; im = i; }
```

default argument
(默認實參)

assignments
(賦值)

①

```cpp
class complex
{
public:
  complex (double r = 0, double i = 0)
    : re (r), im (i)
  { }
  complex& operator += (const complex&);
  double real () const { return re; }
  double imag () const { return im; }
private:
  double re, im;

  friend complex& __doapl (complex*, const complex&);
};
```

?!

initialization list
(初值列, 初始列)

```cpp
{
  complex c1(2,1);
  complex c2;
  complex* p = new complex(4);
  ...
}
```

22

ctor (構造函數) 可以有很多個 – overloading (重載)

①

```cpp
class complex
{
public:
①    complex (double r = 0, double i = 0)
       : re (r), im (i)
     { }
②    complex () : re(0), im(0) { }   ?!
     complex& operator += (const complex&);
①    double real () const { return re; }
     double imag () const { return im; }
private:
     double re, im;

     friend complex& __doapl (complex*, const complex&);
};
```

```cpp
{
     complex c1;
     complex c2();
     ...
}
```

②
```cpp
void real(double r) const {   re = r;   }
```

real 函數編譯後的實際名稱可能是：

```
?real@Complex@@QBENXZ
?real@Complex@@QAENABN@Z
```

取決於編譯器

23

constructor (ctor, 構造函數) 被放在 private 區

1

```cpp
class complex
{
public:
  complex (double r = 0, double i = 0)
    : re (r), im (i)
  { }
  complex& operator += (const complex&);
  double real () const { return re; }
  double imag () const { return im; }
private:
  double re, im;

  friend complex& __doapl (complex*, const complex&);
};
```

X
```cpp
{
  complex c1(2,1);
  complex c2;
  ...
}
```

ctors 放在 private 區

```
class A {
public:
  static A& getInstance();
  setup() { ... }
private:
  A();
  A(const A& rhs);
  ...
};

A& A::getInstance()
{
  static A a;
  return a;
}
```

```
A::getInstance().setup();
```

25

const member functions (常量成員函數)

1

```cpp
class complex
{
public:
  complex (double r = 0, double i = 0)
    : re (r), im (i)
  { }
  complex& operator += (const complex&);
  double real () const { return re; }
  double imag () const { return im; }
private:
  double re, im;

  friend complex& __doapl (complex*, const complex&);
};
```

O
```cpp
{
  complex c1(2,1);
  cout << c1.real();
  cout << c1.imag();
}
```

?!
```cpp
{
  const complex c1(2,1);
  cout << c1.real();
  cout << c1.imag();
}
```

26

參數傳遞：pass __by value__ vs. pass __by reference__ (to const)

①
```cpp
class complex
{
public:
    complex (double r = 0, double i = 0)
        : re (r), im (i)
    { }
    complex& operator += (const complex&);
    double real () const { return re; }
    double imag () const { return im; }
private:
    double re, im;

    friend complex& __doapl (complex*, const complex&);
};
```

2-7
```cpp
ostream&
operator << (ostream& os, const complex& x)
{
    return os << '(' << real (x) << ','
              << imag (x) << ')';
}
```

```cpp
{
    complex c1(2,1);
    complex c2;

    c2 += c1;
    cout << c2;
}
```

27

1

```cpp
class complex
{
public:
  complex (double r = 0, double i = 0)
    : re (r), im (i)
  { }
  complex& operator += (const complex&);
  double real () const { return re; }
  double imag () const { return im; }
private:
  double re, im;

  friend complex& __doapl (complex*, const complex&);
};
```

2-7

```cpp
ostream&
operator << (ostream& os, const complex& x)
{
  return os << '(' << real (x) << ','
            << imag (x) << ')';
}
```

```cpp
{
  complex c1(2,1);
  complex c2;

  cout << c1;
  cout << c2 << c1;
}
```

28

friend (友元)

❶
```cpp
class complex
{
public:
  complex (double r = 0, double i = 0)
    : re (r), im (i)
  { }
  complex& operator += (const complex&);
  double real () const { return re; }
  double imag () const { return im; }
private:
  double re, im;

  friend complex& __doapl (complex*, const complex&);
};
```

2-1
```cpp
inline complex&
__doapl (complex* ths, const complex& r)
{
  ths->re += r.re;
  ths->im += r.im;
  return *ths;
}
```

自由取得 friend 的
private 成員

29

相同 class 的各個 objects 互為 friends (友元)

```cpp
class complex
{
public:
  complex (double r = 0, double i = 0)
    : re (r), im (i)
  { }

  int func(const complex& param)
  { return param.re + param.im; }

private:
  double re, im;
};
```

```cpp
{
  complex c1(2,1);
  complex c2;

  c2.func(c1);
}
```

class body 外的各種定義 (definitions)

什麼情況下可以 **pass by reference**

什麼情況下可以 **return by reference**

do assignment plus

2-1

```cpp
inline complex&
__doapl(complex* ths, const complex& r)
{
  ths->re += r.re;        第一參數將會被改動
  ths->im += r.im;        第二參數不會被改動
  return *ths;
}

inline complex&
complex::operator += (const complex& r)
{
  return __doapl (this, r);
}
```

2-1

```
inline complex&
__doapl(complex* ths, const complex& r)
{
  ths->re += r.re;
  ths->im += r.im;
  return *ths;
}

inline complex&
complex::operator += (const complex& r)
{
  return __doapl (this, r);
}
```

```
{
  complex c1(2,1);
  complex c2(5);

  c2 += c1;
}
```

```
inline complex&
complex::operator += (this, const complex& r)
{
  return __doapl (this, r);
}
```

return by reference 語法分析

傳遞者無需知道接收者是以 reference 形式接收

2-1

```
inline complex&
__doapl(complex* ths, const complex& r)
{
  ...
  return *ths;
}

inline complex&
complex::operator += (const complex& r)
{
  return __doapl(this,r);
}
```

c3 += c2 += c1;

```
{
  complex c1(2,1);
  complex c2(5);

  c2 += c1;
}
```

class body 之外的各種定義 (definitions)

2-2

```cpp
inline double
imag(const complex& x)
{
  return x.imag ();
}

inline double
real(const complex& x)
{
  return x.real ();
}
```

```cpp
{
  complex c1(2,1);

  cout << imag(c1);
  cout << real(c1);
}
```

operator overloading (操作符重載-2, 非成員函數) (無 this)

2-3 為了對付 client 的三種可能用法，這兒對應開發三個函數

```cpp
inline complex
operator + (const complex& x, const complex& y)
{
    return complex (real (x) + real (y),
                    imag (x) + imag (y));
}

inline complex
operator + (const complex& x, double y)
{
    return complex (real (x) + y, imag (x));
}

inline complex
operator + (double x, const complex& y)
{
    return complex (x + real (y), imag (y));
}
```

```cpp
{
    complex c1(2,1);
    complex c2;

    c2 = c1 + c2;
    c2 = c1 + 5;
    c2 = 7 + c1;
}
```

temp object (臨時對象) *typename* ();

下面這些函數絕不可 **return by reference**，因為，它們返回的必定是個 **local object.**

```cpp
inline complex
operator + (const complex& x, const complex& y)
{
  return complex (real (x) + real (y),
                  imag (x) + imag (y));
}

inline complex
operator + (const complex& x, double y)
{
  return complex (real (x) + y, imag (x));
}

inline complex
operator + (double x, const complex& y)
{
  return complex (x + real (y), imag (y));
}
```

```cpp
{
  int(7);

  complex c1(2,1);
  complex c2;
  complex();
  complex(4,5);

  cout << complex(2);
}
```

class body 之外的各種定義 (definitions)

2-4

```cpp
inline complex
operator + (const complex& x)
{
  return x;
}

inline complex
operator - (const complex& x)
{
  return complex (-real (x), -imag (x));
}
```

negate
反相
(取反)

這個函數絕不可
return by reference，
因為其返回的
必定是個 **local object**。

```cpp
{
  complex c1(2,1);
  complex c2;
  cout << -c1;
  cout << +c1;
}
```

37

operator overloading (操作符重載), 非成員函數

2-5

```cpp
inline bool
operator == (const complex& x,
             const complex& y)
{
  return real (x) == real (y)
      && imag (x) == imag (y);
}

inline bool
operator == (const complex& x, double y)
{
  return real (x) == y && imag (x) == 0;
}

inline bool
operator == (double x, const complex& y)
{
  return x == real (y) && imag (y) == 0;
}
```

```cpp
{
  complex c1(2,1);
  complex c2;

  cout << (c1 == c2);
  cout << (c1 == 2);
  cout << (0 == c2);
}
```

38

operator overloading (操作符重載), 非成員函數

2-6

```cpp
inline bool
operator != (const complex& x,
             const complex& y)
{
  return real (x) != real (y)
      || imag (x) != imag (y);
}

inline bool
operator != (const complex& x, double y)
{
  return real (x) != y || imag (x) != 0;
}

inline bool
operator != (double x, const complex& y)
{
  return x != real (y) || imag (y) != 0;
}
```

```cpp
{
  complex c1(2,1);
  complex c2;

  cout << (c1 != c2);
  cout << (c1 != 2);
  cout << (0 != c2);
}
```

operator overloading (操作符重載), 非成員函數

```cpp
inline complex                    共軛複數         2-7
conj (const complex& x)
{
  return complex (real (x), -imag (x));
}

#include <iostream.h>
ostream&
operator << (ostream& os, const complex& x)
{
  return os << '(' << real (x) << ','
            << imag (x) << ')';
}
```

?!

```cpp
void
operator << (ostream& os,
             const complex& x)
{
  return os << '(' << real (x) << ','
            << imag (x) << ')';
}
```

```cpp
{
  complex c1(2,1);
  cout << conj(c1);
  cout << c1 << conj(c1);
}
```

(2,-1)
(2,1)(2,-1)

```cpp
{
  complex c1(2,1);
  cout << conj(c1);
  cout << c1 << conj(c1);
}
```

40

```
#ifndef __COMPLEX__
#define __COMPLEX__

class complex
{
public:
  complex (double r = 0, double i = 0)
    : re (r), im (i)
  { }
  complex& operator += (const complex&);
  double real () const { return re; }
  double imag () const { return im; }
private:
  double re, im;

  friend complex& __doapl (complex*,
                           const complex&);
};

#endif
```

42

```
inline complex&
__doapl(complex* ths, const complex& r)
{
  ths->re += r.re;
  ths->im += r.im;
  return *ths;
}

inline complex&
complex::operator += (const complex& r)
{
  return __doapl (this, r);
}
```

```
inline complex
operator + (const complex& x, const complex& y)
{
  return complex ( real (x) + real (y),
                   imag (x) + imag (y)  );
}

inline complex
operator + (const complex& x, double y)
{
  return complex (real (x) + y, imag (x));
}

inline complex
operator + (double x, const complex& y)
{
  return complex (x + real (y), imag (y));
}
```

```
#include <iostream.h>
ostream&
operator << (ostream& os,
             const complex& x)
{
  return os << '(' << real (x) << ','
            << imag (x) << ')';
}
```

```
complex c1(9,8);
cout << c1;
```
?! ~~c1 << cout;~~

<mark>cout << c1</mark> << endl;

complex.h
complex-test.cpp

string.h
string-test.cpp

Classes 的兩個經典分類

- **Class without pointer member(s)**

    complex

- **Class with pointer member(s)**

    string

String class

```
#ifndef __MYSTRING__          string.h
#define __MYSTRING__

① class String
  {
  ...
  };

② String::function(...) ...

  Global-function(...) ...

  #endif
```

```
int main()                    string-test.cpp
{
   String s1(),
   String s2("hello");

   String s3(s1);
   cout << s3 << endl;
   s3 = s2;

   cout << s3 << endl;
}
```
48

Big Three, 三個特殊函數

```
class String
{
public:
   String(const char* cstr = 0);
   String(const String& str);
   String& operator=(const String& str);
   ~String();
   char* get_c_str() const { return m_data; }
private:
   char* m_data;
};
```

1

m_data

hello

ctor 和 dtor (構造函數 和 析構函數)

2-1

```cpp
inline
String::String(const char* cstr = 0)
{
    if (cstr) {
        m_data = new char[strlen(cstr)+1];
        strcpy(m_data, cstr);
    }
    else {   // 未指定初值
        m_data = new char[1];
        *m_data = '\0';
    }
}

inline
String::~String()
{
    delete[] m_data;
}
```
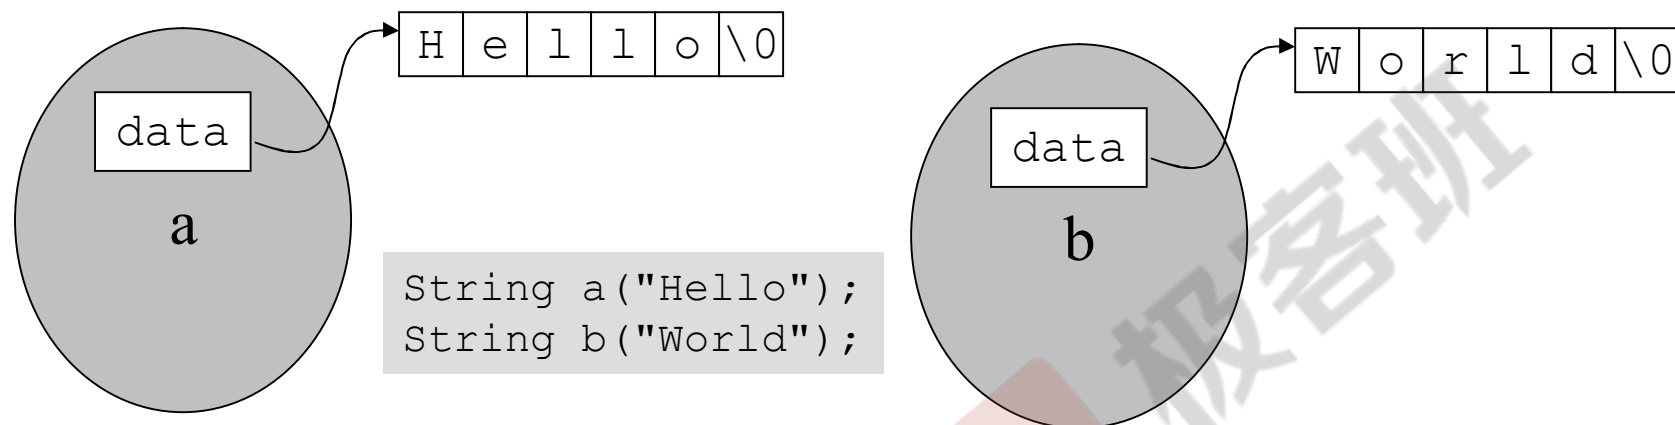

hello

```cpp
{
    String s1(),
    String s2("hello");

    String* p = new String("hello");
    delete p;
}
```
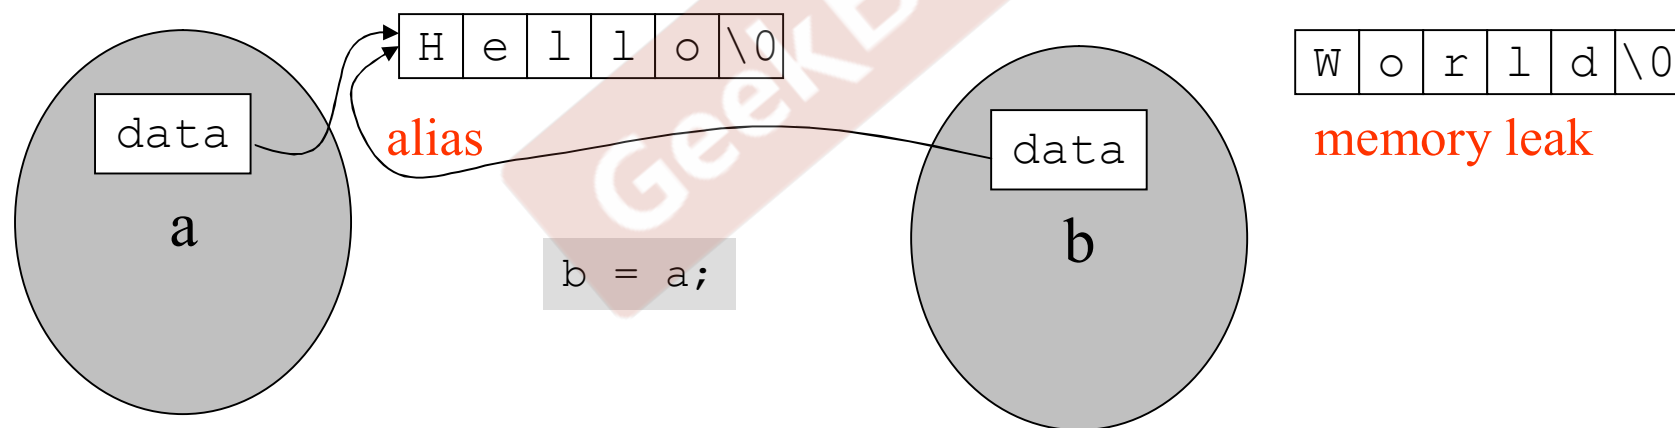

class with pointer members 必須有 copy ctor 和 copy op=

```
H  e  l  l  o  \0
```

data

a

```
String a("Hello");
String b("World");
```

```
W  o  r  l  d  \0
```

data

b

使用 default copy ctor 或 default op= 就會形成以下局面

```
H  e  l  l  o  \0
```

data

a

alias

```
b = a;
```

data

b

```
W  o  r  l  d  \0
```

memory leak

51

copy ctor (拷貝構造函數)

2-2

```
inline
String::String(const String& str)
{
    m_data = new char[ strlen(str.m_data) + 1 ];
    strcpy(m_data, str.m_data);
}
```

```
{
    String s1("hello ");
    String s2(s1);
// String s2 = s1;
}
```

直接取另一個 **object** 的 **private data.**
(兄弟之間互為 **friend)**

copy assignment operator (拷貝賦值函數)

2-3

```cpp
inline
String& String::operator=(const String& str)
{
    if (this == &str)        檢測自我賦值
        return *this;        (self assignment)

1   delete[] m_data;
2   m_data = new char[ strlen(str.m_data) + 1 ];
3   strcpy(m_data, str.m_data);
    return *this;
}
```

```cpp
{
    String s1("hello ");
    String s2(s1);
    s2 = s1;
}
```

H	e	\0

# copy assignment operator (拷貝賦值函數)

2-3

```
inline
String& String::operator=(const String& str)
{
    if (this == &str)        檢測自我賦值
        return *this;        (self assignment)

  ① delete[] m_data;
  ② m_data = new char[ strlen(str.m_data) + 1 ];
  ③ strcpy(m_data, str.m_data);
    return *this;
}
```

③

| W | o | r | l | d | \0 |

| W | o | r | l | d | \0 |

a

b

■■■■ 一定要在 **operator=** 中檢查是否 **self assignment**

```
H e l l o \0
```

data *this

data rhs

```
a = a;
```

左右 pointers 指向
同一個 memory block
前述 operator= 的第一件事情就是 `delete`，造成這般結果：

???

data *this

data rhs
然後，當企圖存取 (訪問) *rhs*，產生不確定行為 (undefined behavior)

output 函數

2-4
```cpp
#include <iostream.h>
ostream& operator<<(ostream& os, const String& str)
{
    os << str.get_c_str();
    return os;
}
```

```cpp
{
    String s1("hello ");
    cout << s1;
}
```

所謂 stack (棧), 所謂 heap (堆)

Stack，是存在於某作用域 **(scope)** 的一塊內存空間 **(memory space)**。例如當你調用函數，函數本身即會形成一個 **stack** 用來放置它所接收的參數，以及返回地址。

在函數本體 **(function body)** 內聲明的任何變量，其所使用的內存塊都取自上述 **stack**。

Heap，或謂 **system heap**，是指由操作系統提供的一塊 **global** 內存空間，程序可動態分配 **(dynamic allocated)** 從某中獲得若干區塊 **(blocks)**。

```
class Complex { … };
...
{
  Complex c1(1,2);
  Complex* p = new Complex(3);
}
```

`c1` 所佔用的空間來自 stack

Complex(3) 是個臨時對象，其所佔用的空間乃是以 `new` 自 heap 動態分配而得，並由 `p` 指向。

◼◼◼◼ **stack objects** 的生命期

```
class Complex { ... };
...

{
  Complex c1(1,2);
}
```

c1 便是所謂 stack object，其生命在作用域 (scope) 結束之際結束。
這種作用域內的 object，又稱為 auto object，因為它會被「自動」清理。

static local objects 的生命期

```
class Complex { … };
...

{
   static Complex c2(1,2);
}
```

c2 便是所謂 static object，其生命在作用域 (scope)
結束之後仍然存在，直到整個程序結束。

▰▰▰▰ global objects 的生命期

```
class Complex { … };
...
Complex c3(1,2);

int main()
{
   ...
}
```

c3 便是所謂 global object，其生命在整個程序結束之後
才結束。你也可以把它視為一種 static object，其作用域
是「整個程序」。

heap objects 的生命期

```
class Complex { … };
...

{
  Complex* p = new Complex;
  ...
  delete p;
}
```

```
class Complex { … };
...

{
  Complex* p = new Complex;
}
```

p 所指的便是 heap object，其生命在它被 **delete**d 之際結束。

以上出現內存洩漏 (memory leak)，因為當作用域結束，**p** 所指的 heap object 仍然存在，但指針 **p** 的生命卻結束了，作用域之外再也看不到 **p** (也就沒機會 **delete p**)

new：先分配 memory, 再調用 ctor

```
Complex* pc = new Complex(1,2);
```

編譯器轉化為

① pc →

double

double

} 設初值 ③

```
class Complex
{
public:
  Complex(...) {...}  ③
...
private:
  double m_real;
  double m_imag;
};
```
其內部調用 malloc(n)

```
Complex *pc;

① void* mem = operator new( sizeof(Complex) );  //分配內存
② pc = static_cast<Complex*>(mem);               //轉型
③ pc->Complex::Complex(1,2);                      //構造函數
```

```
Complex::Complex(pc,1,2);
```

this

64

delete：先調用 dtor, 再釋放 memory

```
class Complex
{
public:
    ~Complex() {...}
...
private:
    double m_real;
    double m_imag;
};
```

pc

double
double

清理

1

2

```
Complex* pc = new Complex(1,2);
...
delete pc;
```

編譯器轉化為

1 `Complex::~Complex(pc);` // 析構函數
2 `operator delete(pc);` // 釋放內存

其內部調用 `free(pc)`

new：先分配 memory，再調用 ctor

```
class String
{
public:
  String(...)
  {...
   m_data =
   new char[n];
   ...
  }
private:
  char* m_data;
};
```

ps
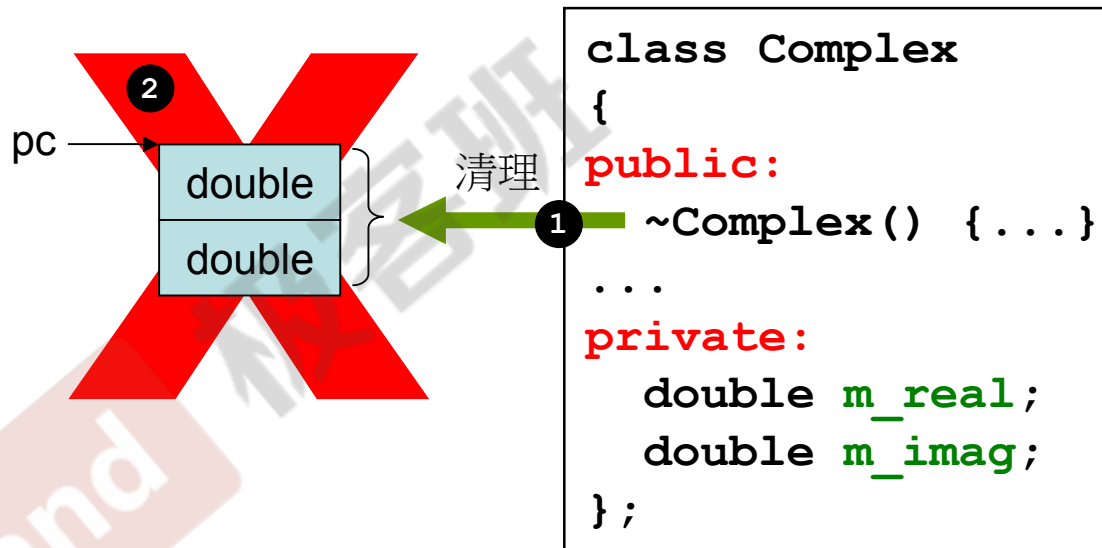

m_data

Hello

```
String* ps = new String("Hello");
```
編譯器轉化為

其內部調用 `malloc(n)`

```
String* ps;

❶ void* mem = operator new( sizeof(String) ); //分配內存
❷ ps = static_cast<String*>(mem);              //轉型
❸ ps->String::String("Hello");                 //構造函數
```

```
String::String(ps,"Hello");
```

this

66

delete：先調用 dtor, 再釋放 memory

```
class String
{
public:
    ~String()
    { delete[] m_data; }
    ...
private:
    char* m_data;
};
```

```
String* ps = new String("Hello");
...
delete ps;
```

編譯器轉化為

❶ `String::~String(ps);`   // 析構函數
❷ `operator delete(ps);`   // 釋放內存

其內部調用 `free(ps)`

ps

❷

❶

m_data

69
array new 一定要搭配 array delete

```
String* p = new String[3];
...
delete[] p;  //唤起3次dtor
```

```
String* p = new String[3];
...
delete p;  //唤起1次dtor
```

不正確的用法
少了 **[ ]**
```
class String
{
public:
    String(const char* cstr = 0);
    String(const String& str);
    String& operator=(const String& str);
    ~String();
    char* get_c_str() const { return m_data; }
private:
    char* m_data;
};
```

```
inline
String::String(const char* cstr = 0)
{
    if (cstr) {
        m_data = new char[strlen(cstr)+1];
        strcpy(m_data, cstr);
    }
    else {   // 未指定初值
        m_data = new char[1];
        *m_data = '\0';
    }
}

inline
String::~String()
{
    delete[] m_data;
}
```
73

```
inline
String::String(const String& str)
{
    m_data = new char[ strlen(str.m_data) + 1 ];
    strcpy(m_data, str.m_data);
}
```

```cpp
inline
String& String::operator=(const String& str)
{
    if (this == &str)
        return *this;

    delete[] m_data;
    m_data = new char[ strlen(str.m_data) + 1 ];
    strcpy(m_data, str.m_data);
    return *this;
}
```

complex.h
complex-test.cpp

string.h
string-test.cpp

進一步補充：**static**

complex
data members **static** data members
member functions **static** member functions

this

static data members
non-static member functions
static member functions

c1

non-static data members

c2

non-static data members

c3

non-static data members

...

```
complex c1,c2,c3;
cout << c1.real();
cout << c2.real();
```

➡
```
complex c1,c2,c3;
cout << complex::real(&c1);
cout << complex::real(&c2);
```
this

```
class complex
{
public:
   double real () const
      { return this->re; }
private:
   double re, im;
};
```

77

進一步補充：**static**

```
class Account {
public:
    static double m_rate;
    static void set_rate(const double& x) { m_rate = x; }
};
double Account::m_rate = 8.0;

int main() {
  Account::set_rate(5.0);

  Account a;
  a.set_rate(7.0);
}
```

調用 static 函數的方式有二：
(1) 通過 object 調用
(2) 通過 class name 調用

進一步補充：把 ctors 放在 private 區

Meyers Singleton

```cpp
class A {
public:
  static A& getInstance();
  setup() { ... }
private:
  A();
  A(const A& rhs);
  ...
};

A& A::getInstance()
{
  static A a;
  return a;
}
```

`A::getInstance().setup();`

79

進一步補充：把 ctors 放在 private 區

Singleton

```
class A {
public:
  static A& getInstance( return a; );
  setup() { ... }
private:
  A();
  A(const A& rhs);
  static A a;
  ...
};
```

```
A::getInstance().setup();
```

80

```
class _IO_ostream_withassign
  : public ostream {
...
};

extern _IO_ostream_withassign cout;
```

```
class ostream : virtual public ios
{
  public:
    ostream& operator<<(char c);
    ostream& operator<<(unsigned char c) { return (*this) << (char)c; }
    ostream& operator<<(signed char c) { return (*this) << (char)c; }
    ostream& operator<<(const char *s);
    ostream& operator<<(const unsigned char *s)
      { return (*this) << (const char*)s; }
    ostream& operator<<(const signed char *s)
      { return (*this) << (const char*)s; }
    ostream& operator<<(const void *p);
    ostream& operator<<(int n);
    ostream& operator<<(unsigned int n);
    ostream& operator<<(long n);
    ostream& operator<<(unsigned long n);
    ...
}
```

81

進一步補充：**class template,** 類模板

```
template<typename T>
class complex
{
public:
  complex (T r = 0, T i = 0)
    : re (r), im (i)
  { }
  complex& operator += (const complex&);
  T real () const { return re; }
  T imag () const { return im; }
private:
  T re, im;

  friend complex& __doapl (complex*, const complex&);
};
```

```
{
  complex<double> c1(2.5,1.5);
  complex<int> c2(2,6);
  ...
}
```

進一步補充：**function template,** 函數模板

```
stone r1(2,3), r2(3,3), r3;
r3 = min(r1, r2);
```

編譯器會對 function template 進行
引數推導（**argument deduction**）

```
template <class T>
inline
const T& min(const T& a, const T& b)
{
    return b < a ? b : a;
}
```

```
class stone
{
public:
  stone(int w, int h, int we)
    : _w(w), _h(h), _weight(we)
      {    }
  bool operator< (const stone& rhs) const
      { return _weight < rhs._weight; }
private:
  int _w, _h, _weight;
};
```

引數推導的結果，T 為 stone，於
是調用 stone::operator<

進一步補充：**namespace**

```
namespace std
{
  ...
}
```

using directive

```
#include <iostream.h>
using namespace std;

int main()
{
  cin << ...;
  cout << ...;

  return 0;
}
```

using declaration

```
#include <iostream.h>
using std::cout;

int main()
{
  std::cin << ...;
  cout << ...;

  return 0;
}
```

```
#include <iostream.h>

int main()
{
  std::cin << ;
  std::cout << ...;

  return 0;
}
```

- **operator** *type***() const;**
- **explicit complex(…) :** *initialization list* **{ }**
- **pointer-like object**
- **function-like object**
- **Namespace**
- **template specialization**
- **Standard Library**
- **variadic template (since C++11)**
- **move ctor (since C++11)**
- **Rvalue reference (since C++11)**
- **auto (since C++11)**
- **lambda (since C++11)**
- **range-base for loop (since C++11)**
- **unordered containers (Since C++)**
- **…**

革命尚未成功

同志仍需努力

Object Oriented Programming, Object Oriented Design
OOP, OOD

- **Inheritance (繼承)**
- **Composition (複合)**
- **Delegation (委託)**

Composition (複合), 表示 has-a

```cpp
template <class T, class Sequence = deque<T> >
class queue {
  ...
protected:
  Sequence c;      // 底層容器
public:
  // 以下完全利用 c 的操作函數完成
  bool empty() const { return c.empty(); }
  size_type size() const { return c.size(); }
  reference front() { return c.front(); }
  reference back() { return c.back(); }
  // deque 是兩端可進出，queue 是末端進前端出（先進先出）
  void push(const value_type& x) { c.push_back(x); }
  void pop() { c.pop_front(); }
};
```
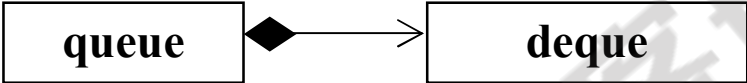

Composition (複合), 表示 has-a

Adapter

```
template <class T>
class queue {
  ...
protected:
 deque<T> c;        // 底層容器
public:
  // 以下完全利用 c 的操作函數完成
  bool empty() const { return c.empty(); }
  size_type size() const { return c.size(); }
  reference front() { return c.front(); }
  reference back() { return c.back(); }
  //
  void push(const value_type& x) { c.push_back(x); }
  void pop() { c.pop_front(); }
};
```

queue ◆——————▶ deque

Composition (複合), 表示 has-a

Sizeof : 40

```
template <class T>
class queue {
protected:
 deque<T> c;
...
};
```

Sizeof : 16 * 2 + 4 + 4

```
template <class T>
class deque {
protected:
  Itr<T> start;
  Itr<T> finish;
  T**      map;
  unsigned int map_size;
};
```

Sizeof : 4 * 4

```
template <class T>
struct Itr {
  T*  cur;
  T*  first;
  T*  last;
  T** node;
...
};
```

Composition (複合) 關係下的構造和析構

Container object
構造由內而外

Container 的構造函數首先調用 **Component** 的 **default** 構造函數，然後才執行自己。

```
Container::Container(…): Component() { … };
```

析構由外而內

Container 的析構函數首先執行自己，然後才調用 **Component** 的析構函數。

```
Container::~Container(…){ … ~Component() };
```

Delegation (委託). Composition by reference.

Handle / Body (pImpl)

```cpp
// file String.hpp
class StringRep;
class String {
public:
    String();
    String(const char* s);
    String(const String& s);
    String &operator=(const String& s);
    ~String();
. . . .
private:
    StringRep* rep; // pimpl
};
```
```
┌─────────┐            ┌───────────┐
│ String  │◇─────────▶│ StringRep │
└─────────┘            └───────────┘
```

```cpp
// file String.cpp
#include "String.hpp"
namespace {
class StringRep {
friend class String;
    StringRep(const char* s);
    ~StringRep();
    int count;
    char* rep;
};
}

String::String(){ ... }
...
```

reference counting

a, b, c → rep → n → rep → Hello
Inheritance (繼承), 表示 is-a

```cpp
struct _List_node_base
{
  _List_node_base* _M_next;
  _List_node_base* _M_prev;
};

template<typename _Tp>
struct _List_node
  : public _List_node_base
{
  _Tp _M_data;
};
```

_List_node_base
_M_next
_M_prev

_List_node	T
_M_data	
Inheritance (繼承) 關係下的構造和析構

Base

Derived

Derived object

Base part
base class 的 dtor
必須是 virtual，
否則會出現
undefined behavior

構造由內而外

Derived 的構造函數首先調用 **Base** 的 **default** 構造函數，然後才執行自己。

```
Derived::Derived(…): Base() { … };
```

析構由外而內

Derived 的析構函數首先執行自己，然後才調用 **Base** 的析構函數。

```
Derived::~Derived(…){ … ~Base() };
```

Inheritance (繼承) with virtual functions (虛函數)

non-virtual 函數：你不希望 **derived class** 重新定義 (override, 覆寫) 它.

virtual 函數：你希望 **derived class** 重新定義 (override, 覆寫) 它，且你對它已有默認定義。

pure virtual 函數：你希望 **derived class** 一定要重新定義 (override 覆寫) 它，你對它沒有默認定義。

```
class Shape {
public:
    virtual void draw( ) const = 0;                    pure virtual
    virtual void error(const std::string& msg);        impure virtual
    int objectID( ) const;                             non-virtual
    ...
};

class Rectangle: public Shape { ... };
class Ellipse: public Shape { ... };
```

94

Check file name

Search file
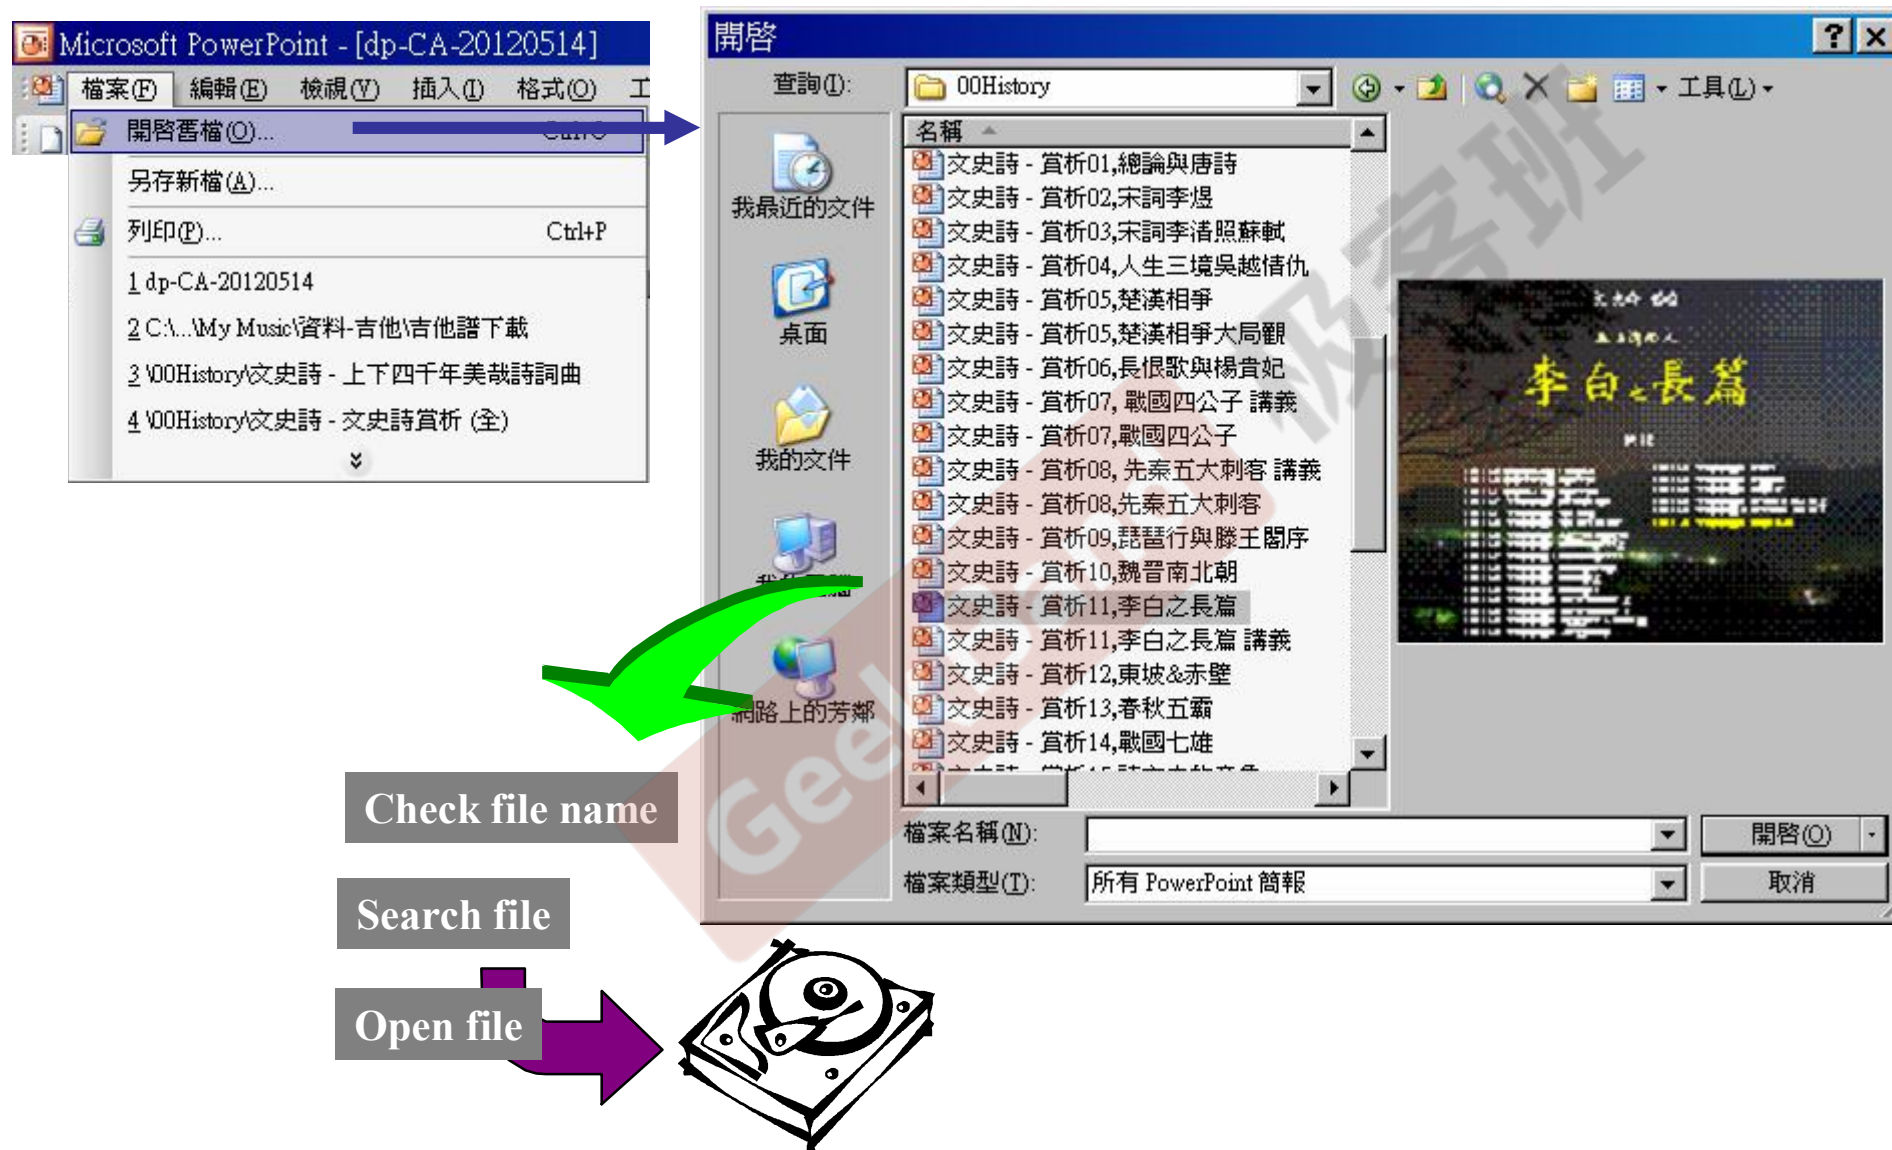

Open file

Inheritance (繼承) with virtual

Template Method

Application framework

Application

```
this->Serialize( );
```

```
(*(this->vptr)[n])(this);
```

```
CDocument::
OnFileOpen()
{
    ...
    Serialize()
    ...
}
```

```
class CMyDoc :
        public CDocument
{
    virtual Serialize() { ... }
};
```

```
main()
{
    CMyDoc myDoc;
    ...
    myDoc.OnFileOpen();
}
```

```
CDocument::OnFileOpen(&myDoc );
```

CDocument

OnFileOpen()
Serialize()

繼承

CMyDoc

Serialize()

96
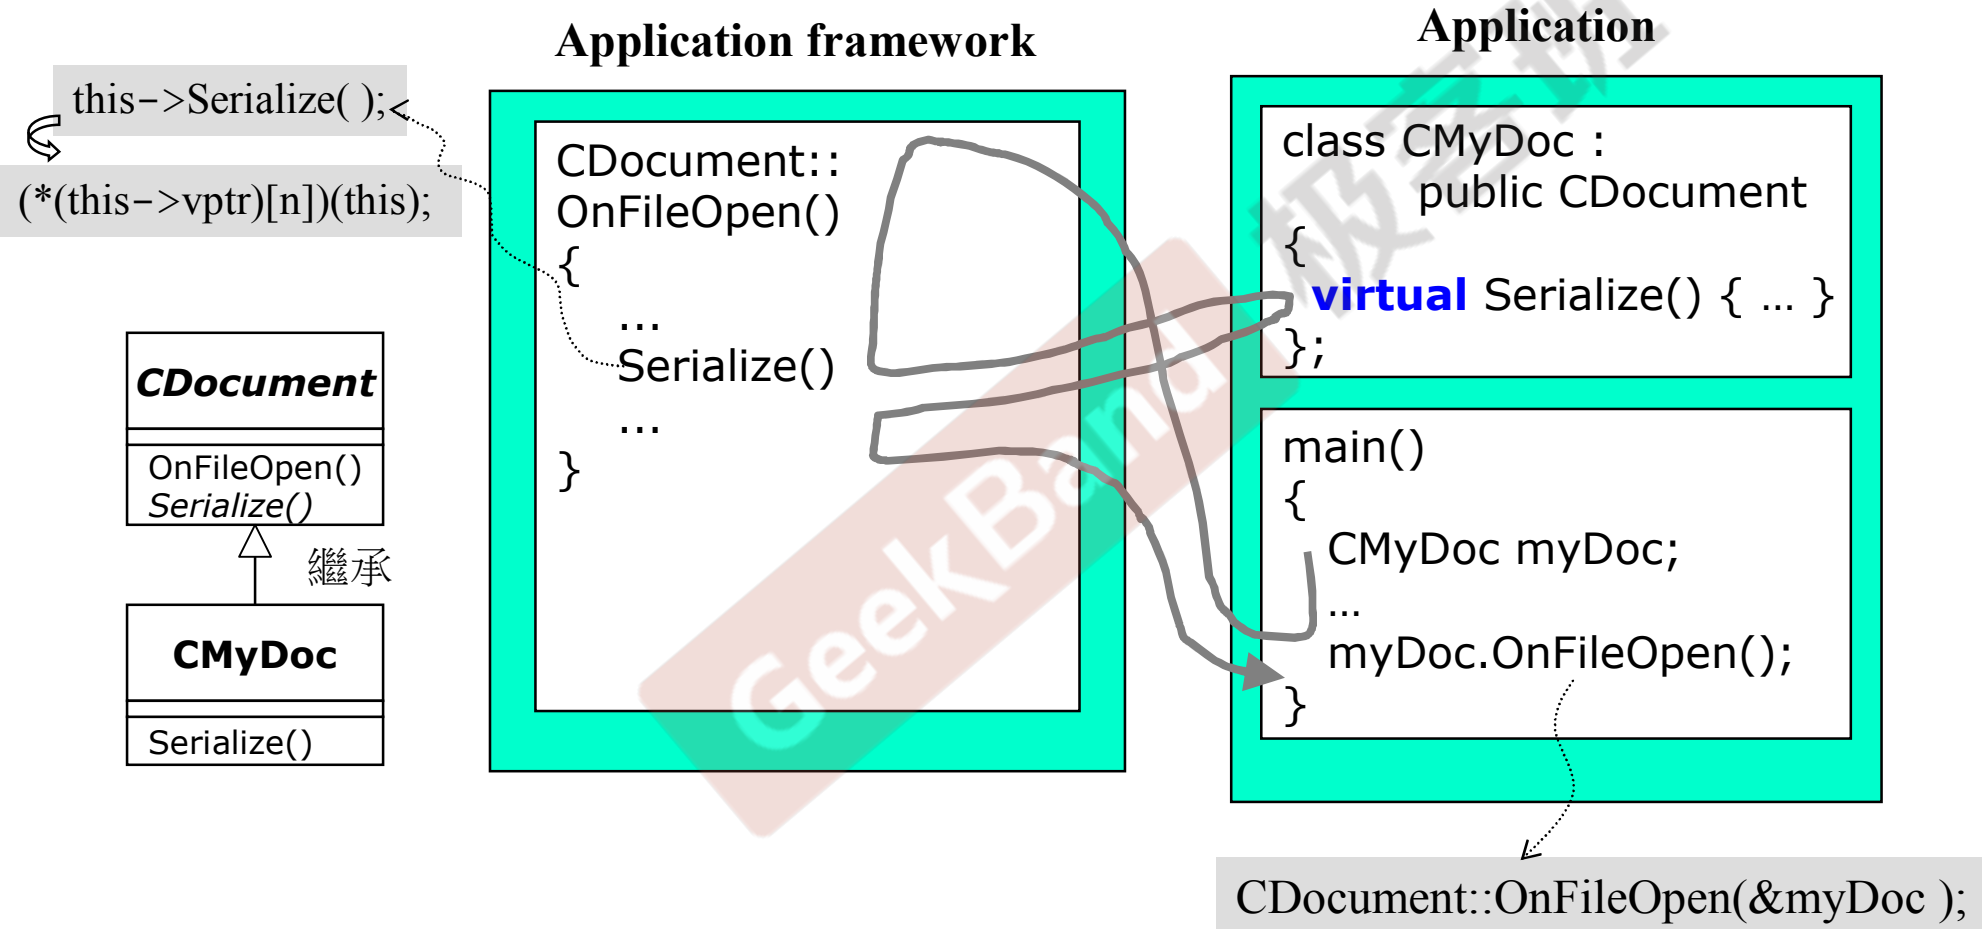

Inheritance (繼承), 表示 is-a

```
01 #include <iostream>
02 using namespace std;
03
04
05 class CDocument
06 {
07 public:
08     void OnFileOpen()
09     {
10      // 這是個算法，每個 cout 輸出代表一個實際動作
11      cout << "dialog..." << endl;
12      cout << "check file status..." << endl;
13      cout << "open file..." << endl;
14      Serialize();
15      cout << "close file..." << endl;
16      cout << "update all views..." << endl;
17     }
18
19     virtual void Serialize() { };
20 };
```
```
22 class CMyDoc : public CDocument
23 {
24 public:
25     virtual void Serialize()
26     {
27         // 只有應用程序本身才知道如何讀取自己的文件(格式)
28         cout << "CMyDoc::Serialize()" << endl;
29     }
30 };
```

```
31 int main()
32 {
33   CMyDoc myDoc;  // 假設對應[File/Open]
34   myDoc.OnFileOpen();
35 }
```

Inheritance+Composition 關係下的構造和析構

Derived object
構造由內而外

Derived 的構造函數首先調用 **Base** 的 **default** 構造函數，
然後調用 **Component** 的 **default** 構造函數，
然後才執行自己。

```
Derived::Derived(…): Base(),Component() { … };
```

析構由外而內

Derived 的析構函數首先執行自己，
然後調用 **Component** 的 析構函數，
然後調用 **Base** 的析構函數。

```
Derived::~Derived(…){ … ~Component(), ~Base() };
```

Delegation (委託) + Inheritance (繼承)

```cpp
class Subject
{
    int m_value;
    vector<Observer*> m_views;
 public:
    void attach(Observer* obs)
    {
        m_views.push_back(obs);
    }
    void set_val(int value)
    {
        m_value = value;
        notify();
    }
    void notify()
    {
        for (int i = 0; i < m_views.size(); ++i)
            m_views[i]->update(this, m_value);
    }
};
```

Observer

```cpp
class Observer
{
 public:
    virtual void update(Subject* sub, int value) = 0;
};
```
```
          n
Subject ◇───────► Observer
                     △
                     ┆
                    ...
```

100

Delegation (委託) + Inheritance (繼承)

Delegation (委託) + Inheritance (繼承)

```cpp
class Subject
{
  int m_value;
  vector<Observer*> m_views;
 public:
  void attach(Observer* obs)
  {
    m_views.push_back(obs);
  }
  void set_val(int value)
  {
    m_value = value;
    notify();
  }
  void notify()
  {
    for (int i = 0; i < m_views.size(); ++i)
      m_views[i]->update(m_value);
  }
};
```

```cpp
class Observer
{
  public:
    virtual void update(int value) = 0;
};
```

```cpp
{
  Subject subj;
  Observer1 o1(&subj, 4);
  Observer1 o2(&subj, 3);
  Observer2 o3(&subj, 3);
  subj.set_val(14);
}
```

n

```cpp
class Observer1: public Observer
{
  int m_div;
 public:
  Observer1(Subject *model, int div)
  {
    model->attach(this);
    m_div = div;
  }
  /* virtual */void update(int v)
  {      …      }
};
```
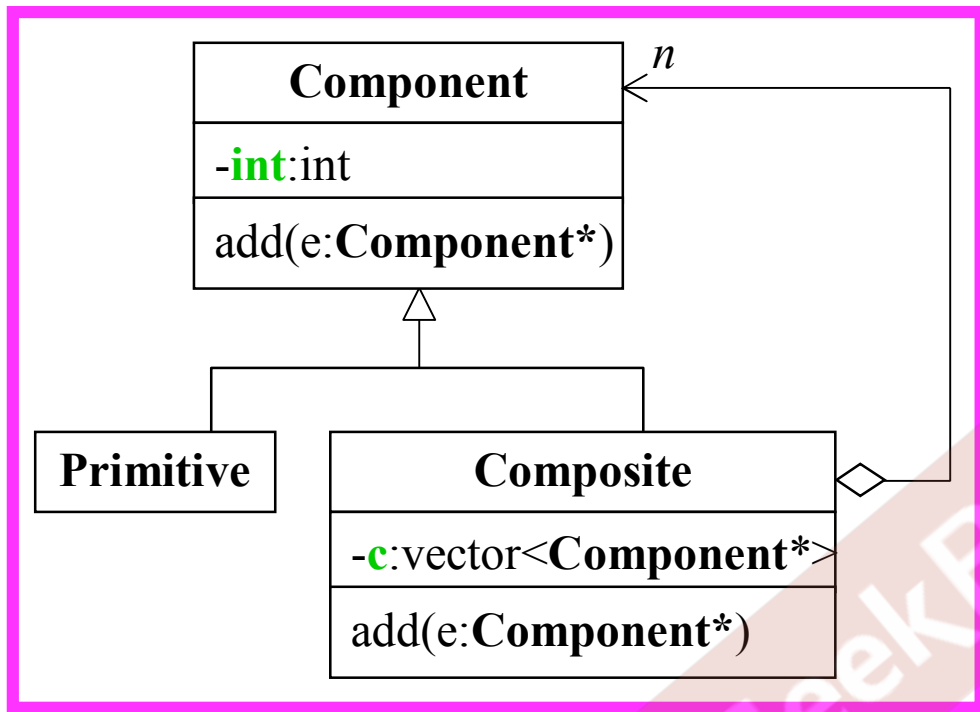

```cpp
class Observer2: public Observer
{
  int m_mod;
 public:
  Observer2(Subject *model, int mod)
  {
    model->attach(this);
    m_mod = mod;
  }
  /* virtual */void update(int v)
  {      ...      }
};
```
